Letter of Recommendation

Dear Admissions Committee,

My name is Aiyim Svambayeva, and I am a lecturer and the coordinator of Siemens Laboratory at Kazakh-British Technical University (KBTU). I taught Rassul Zeinulla in several courses, including SIMATIC S7-1200, Automation Components and Devices, and Metrology and Measurements. I am writing with real pleasure because he is one of those students you remember after the semester ends.

He approached each task with care rather than speed. From the first weeks, I saw his initiative and steady work ethic. In Siemens laboratory classes, he did not try to complete tasks as quickly as possible—instead, he worked carefully and correctly. What I respected most is that he was not focused only on grades. He wanted to understand the logic of the system, check results, ask why something behaved a certain way, and improve the solution step by step. This focus on depth and quality was very clear during lab sessions, and it is a strong sign of a future engineer.

In Metrology and Measurements, he chose an unusual topic - an automated car washing machine - and explained the system in a detailed and structured way. He is also a creative student who enjoys projects with real meaning, especially in robotics and smart systems. He received one of the highest results in the group. In Automation Components and Devices, he presented ambitious ideas: an AI drone system to deliver medicines to remote areas and an AI security camera IoT system to detect illegal entry into a building. These topics were not simple, but he showed that he can take a complex idea and turn it into a clear engineering project.

Another point I want to highlight is his attitude outside regular classes. Rassul spent a lot of extra time in the Siemens Laboratory, sometimes staying until late evening. He often helped our Siemens lab assistant and showed responsibility like a junior engineer, not only like a student. He also worked practically with SIMATIC S7-1200 by connecting it with a stepper motor and controlling it in TIA Portal, which shows his confidence with real automation hardware.

One of his most advanced works was a project about SIMATIC S7-1500 communication with robot manipulators through OPC UA, with programming and modeling using MATLAB and Simulink. This project had a clear research approach and required serious effort. Later, this work received recognition and won 2nd place as one of the best course projects in the cohort for the ASUPT discipline.

In short, Rassul Zeinulla combines curiosity, creativity, and persistence, and he reliably finishes what he starts. As a lecturer and lab head, I am proud to see him use the laboratory not just to “do tasks,” but to grow into a real engineer. For these reasons, I strongly recommend him for your program, and I believe he will bring strong motivation, practical skills, and thoughtful work to any academic or professional environment.

Sincerely,

MS Svambayeva A.S.
